Path of terror

Andrew wreaks havoc in S. Florida

Understanding Hurricanes

Kieran Bhatia

**What do you know
about hurricanes?**

**What do you want
to know?**

Outline

- Why do we care?
- What are they?
- When should we be ready?
- Why aren't forecasts perfect?
- If a hurricane makes landfall, what should we expect?

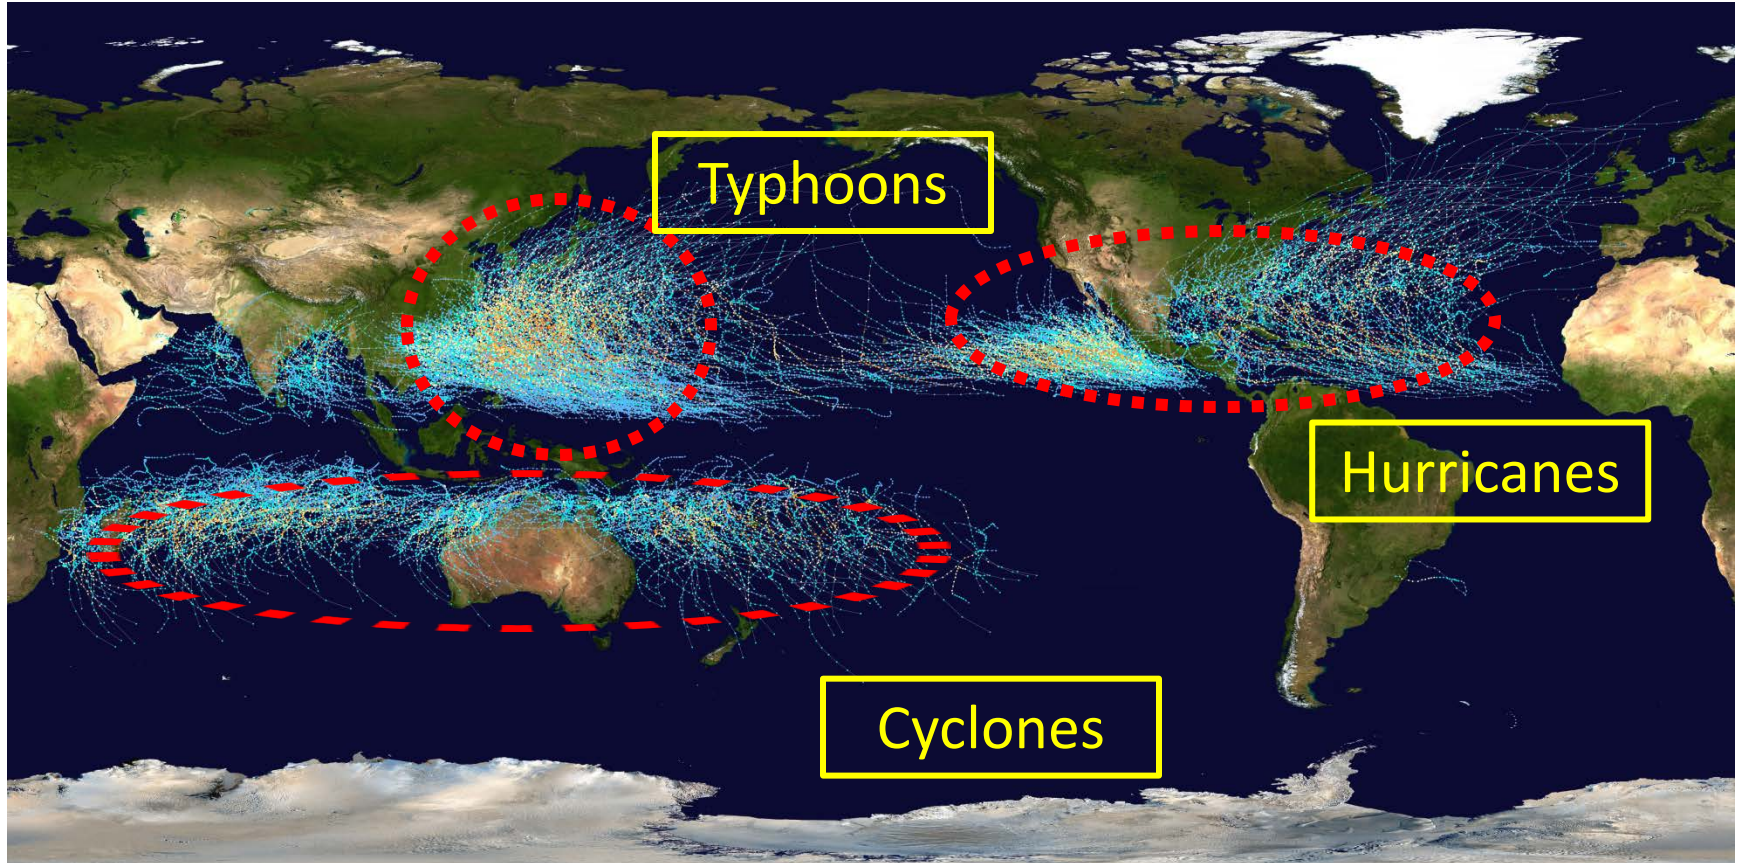

Why Do We Care?

The Name Game

- Tropical cyclones have different names, depending on their location.
 - In the Atlantic Ocean and Eastern Pacific Ocean, weaker systems are called tropical storms and the stronger ones are called **hurricanes**.
 - In the Northwest Pacific Ocean, weaker systems are also called tropical storms, but the stronger ones are called **typhoons**.
 - In the Southwest Pacific and Indian Oceans, they are simply called **cyclones**.

2015 Hurricane Season

What Are They?

A 'Cane?

- Counter-clockwise rotating thunderstorms spinning around a massive low pressure system
- Energy comes from sea water evaporating, rising, and releasing heat
- An area of strong winds and heavy rain
- Only classified by surface wind speed... Saffir-Simpson Scale:
 - Tropical Depression (numbered but not named)
 - Tropical Storm (named... 40mph+, better organized)
 - Hurricane (named... 74mph+, assigned a category 1-5)

The Saffir-Simpson Intensity Scale

Category	Maximum Sustained Winds	Description
Tropical Storm	40-73 mph	
Category 1 Hurricane	74-95 mph	
Category 2 Hurricane	96-110 mph	
Category 3 Hurricane	111-130 mph	
Category 4 Hurricane	131-155 mph	
Category 5 Hurricane	> 155 mph	

25N

20N

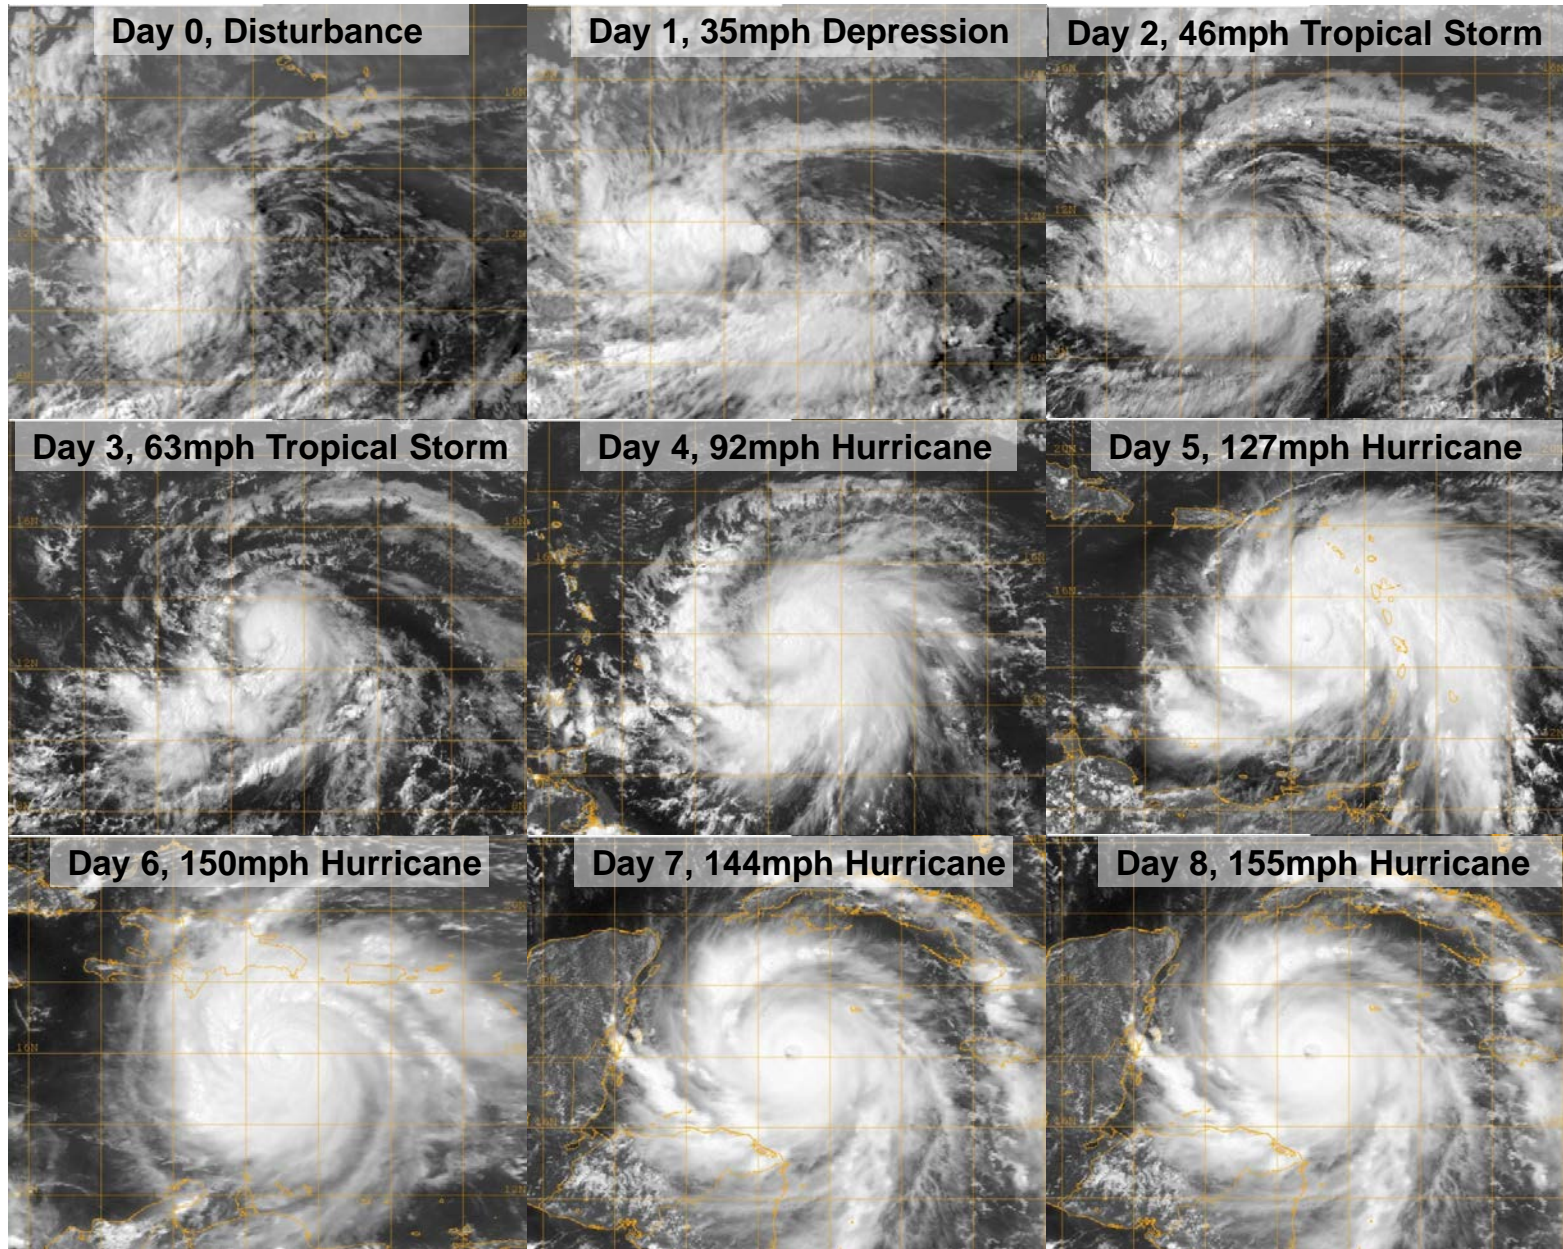

Side-View of a Hurricane

Typical eye width ~20 miles

Typical hurricane width ~300-400 miles

Life Expectancy

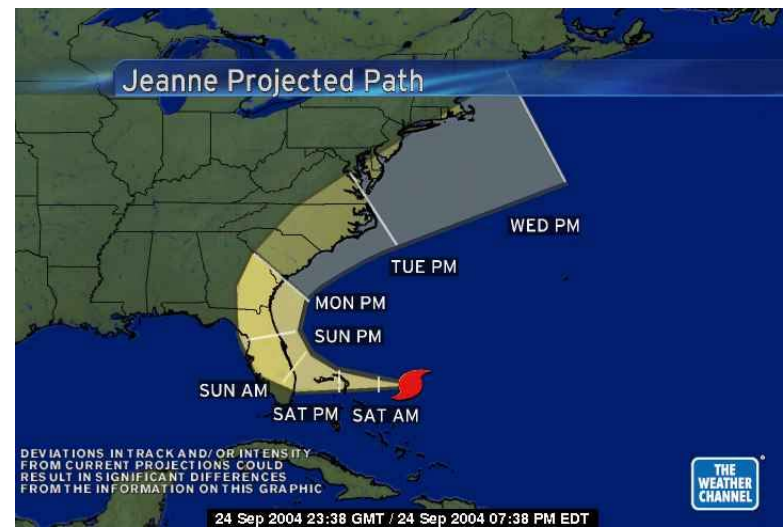

Does Size Matter?

- **Yes**, the bigger a storm is, the more area it will affect with rain, wind, and storm surge, but...
- A larger storm is not necessarily a stronger storm and vice versa.

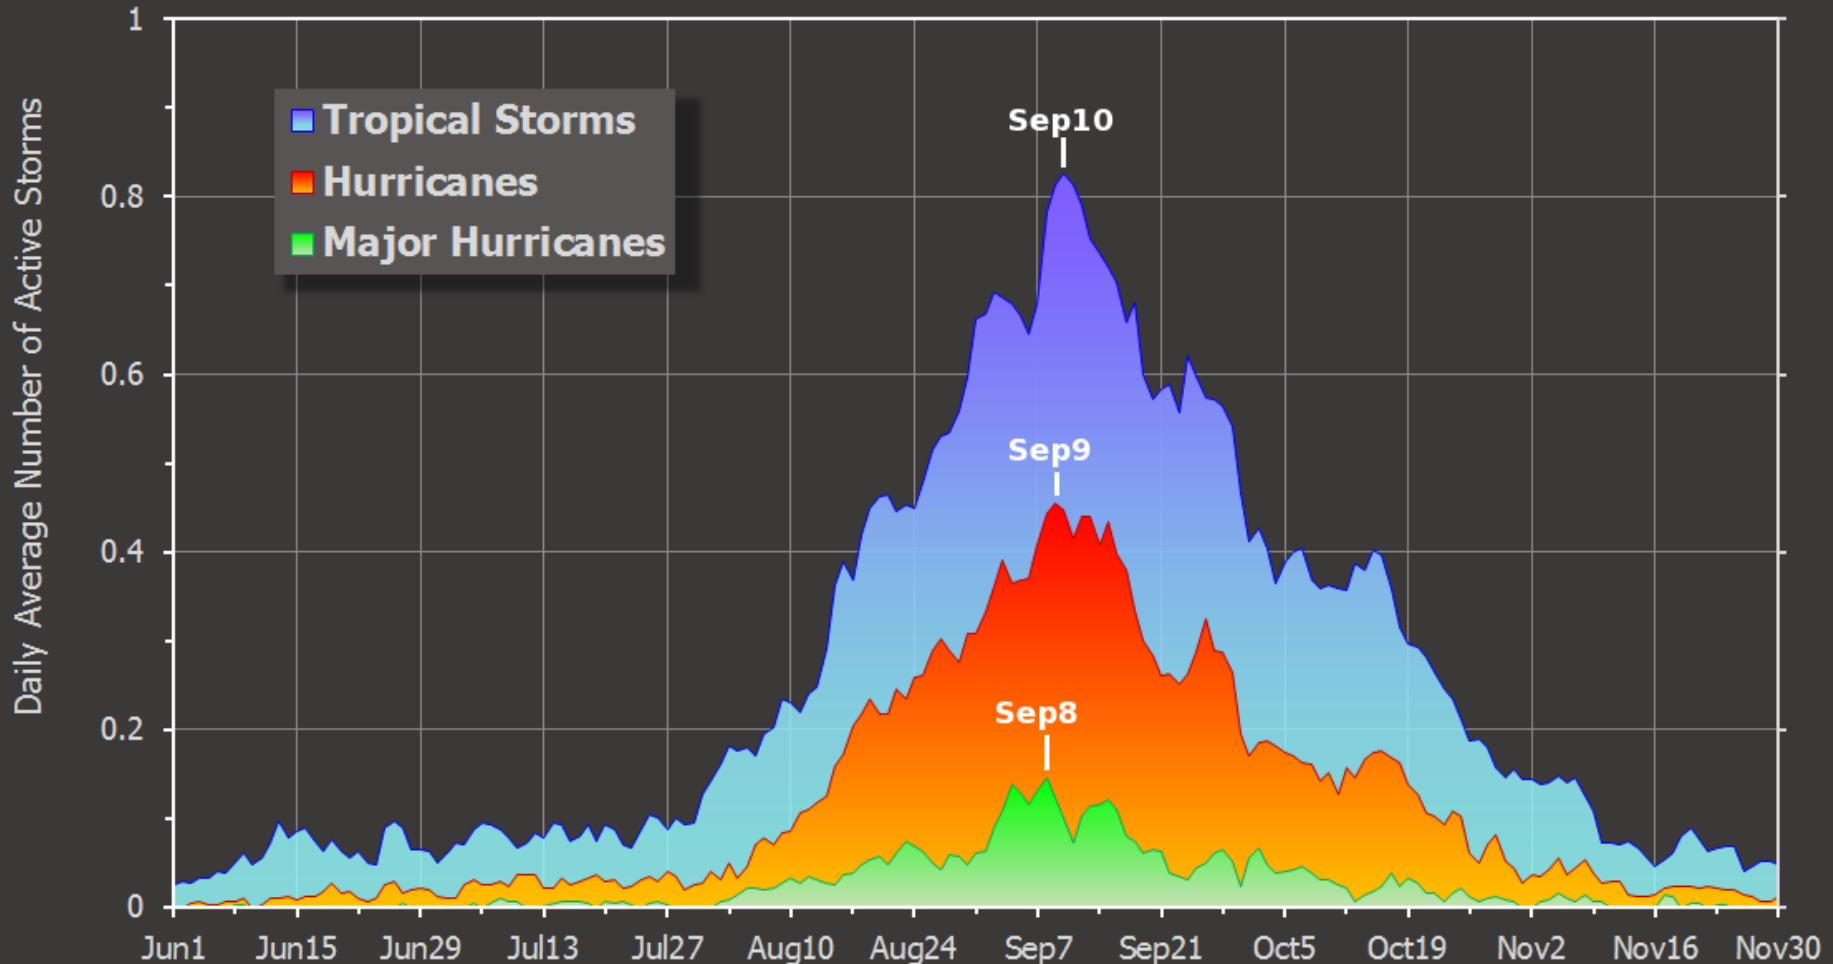

When Should We Be Ready?

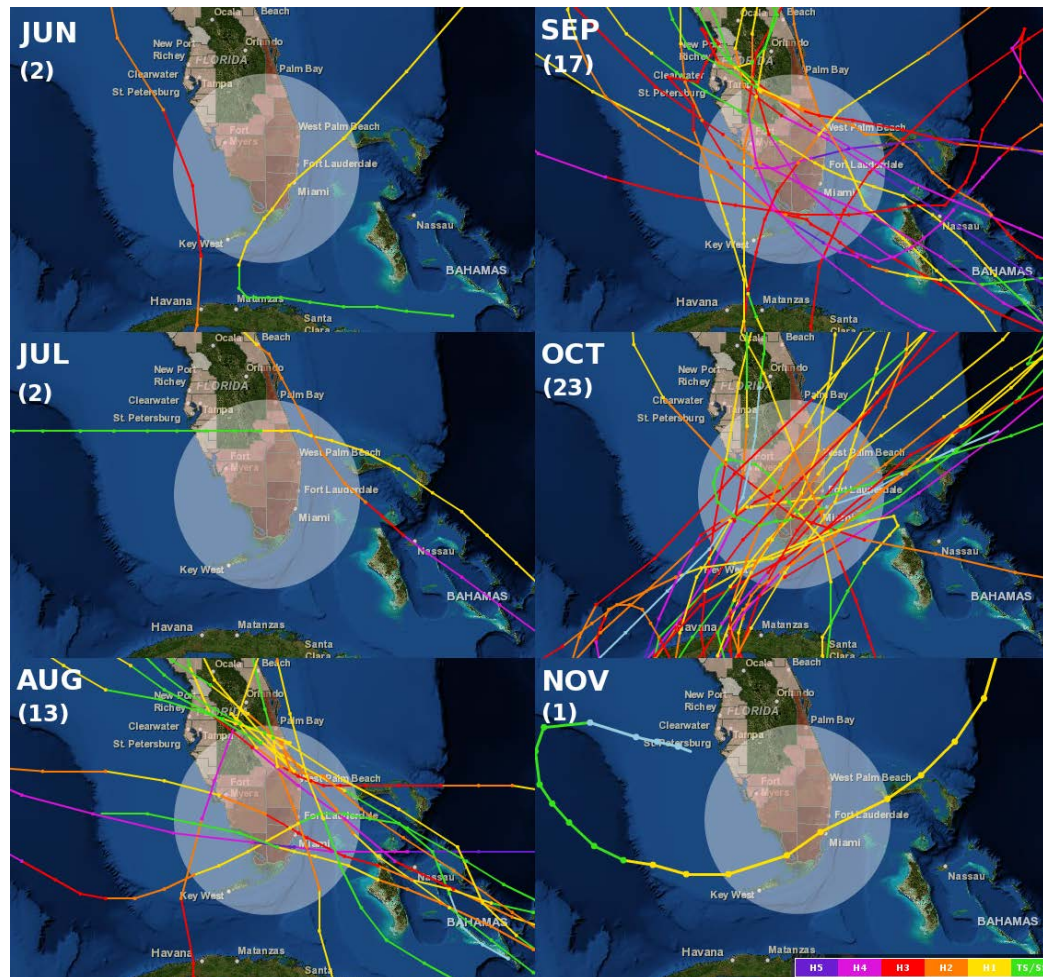

When is it Time to Tune in?

Atlantic Tropical Cyclone Climatology (1851-2013)

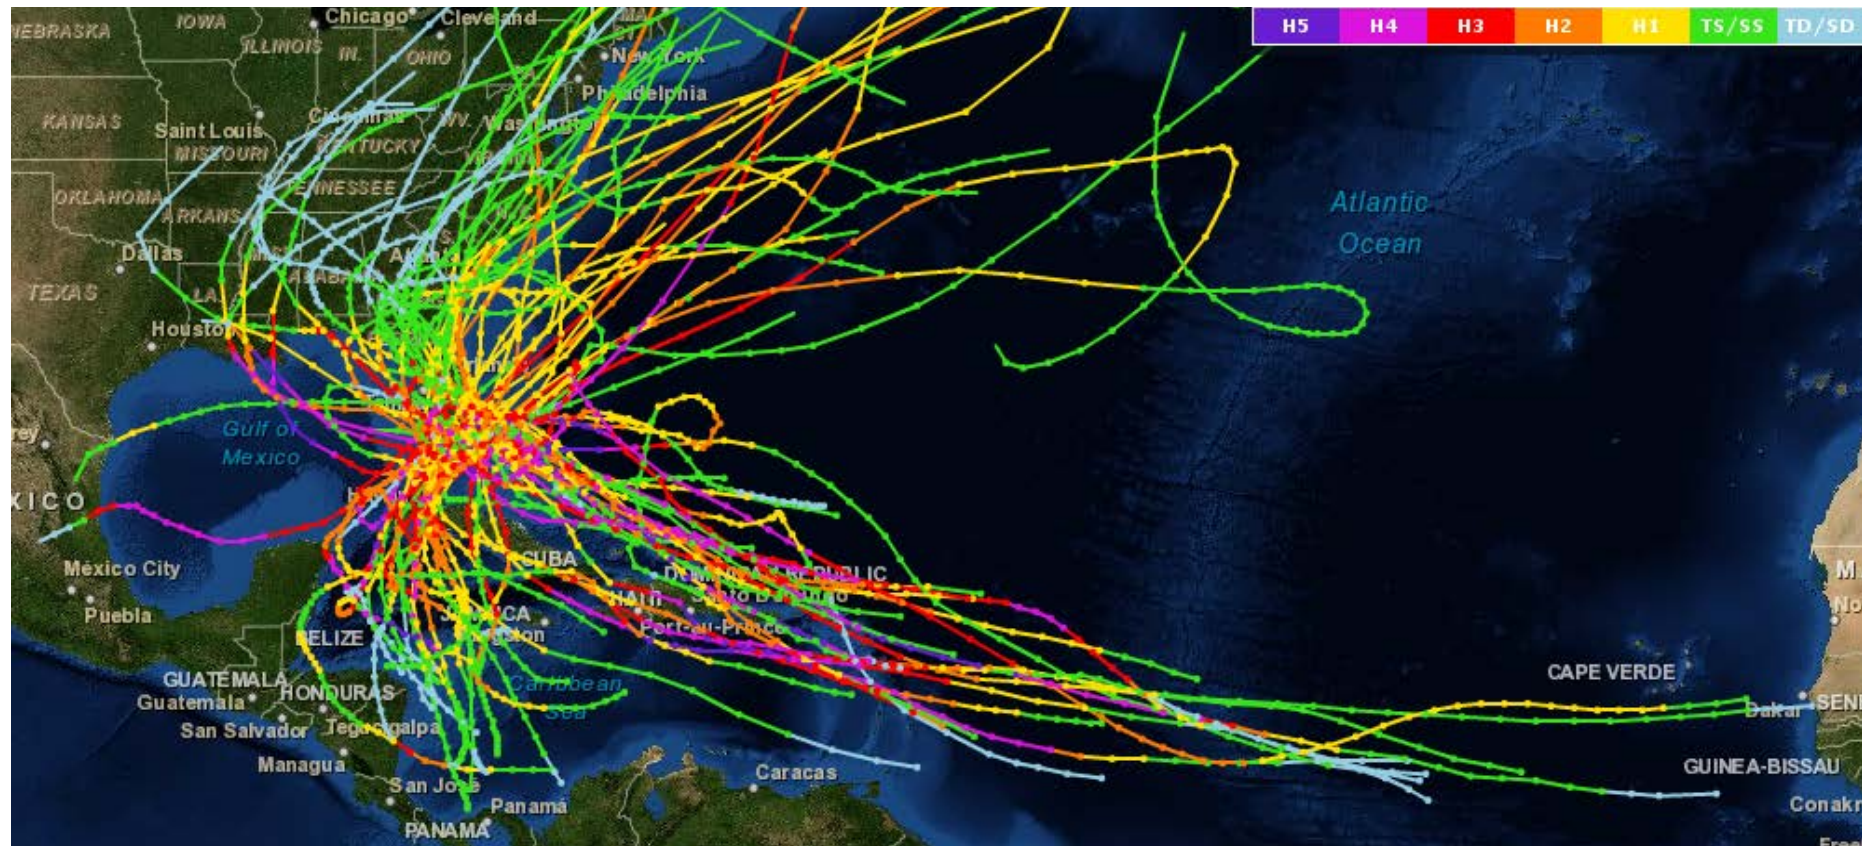

With Great Weather Comes Great Responsibility?

Hurricanes affecting South Florida since 1851

58 (31 major) Hurricanes Passed Through South Florida from 1851-Present

What Month Has Had Most Hurricane Strikes in South FL?

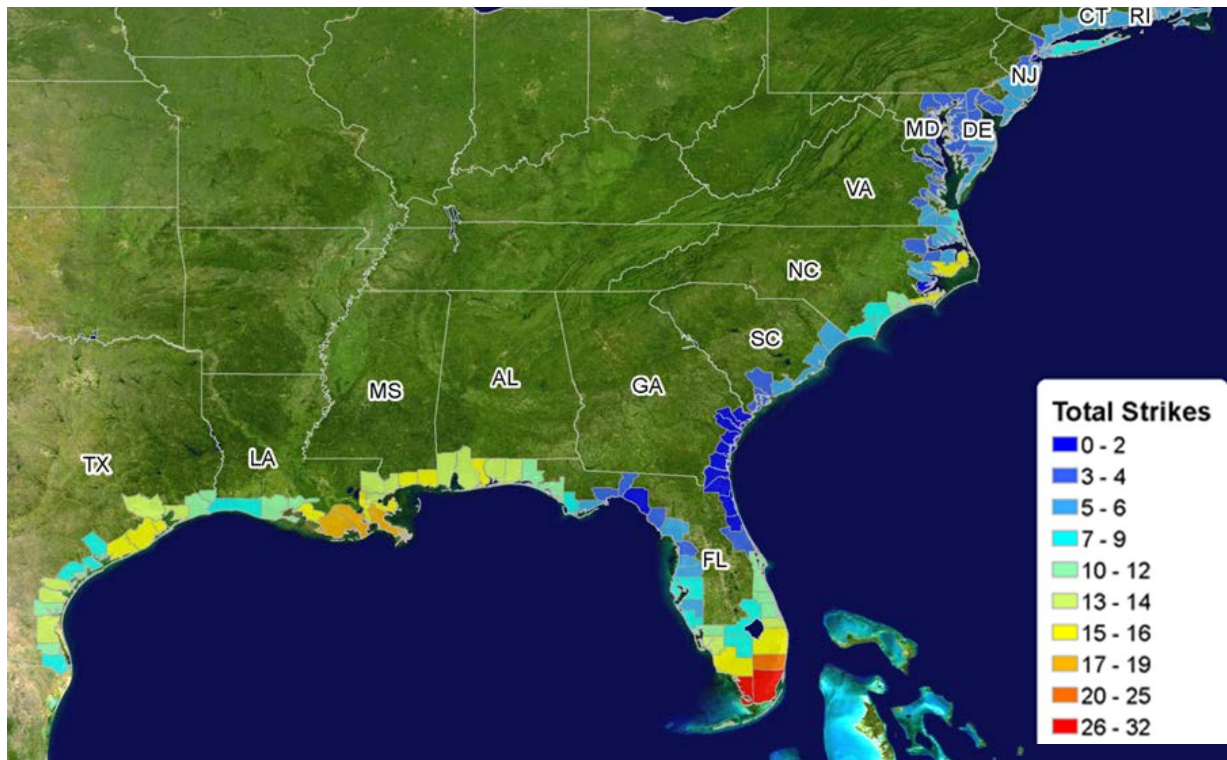

- A) August
- B) October
- C) September
- D) June

Since 1851, 23 hurricanes have struck South Florida in October, compared to 17 in September 13 in August, 2 in July, and 2 in June

It's not "IF", It's "When"

- South Florida is one of the most frequently hit sections of the entire US coastline
- Average of one hurricane per 3 years and one major hurricane every 5.2 years

Total Number of
Strikes Per County,
1900-2010

Why Aren't Hurricane Forecasts Perfect?

1) Taking Measurements

Variety of instruments define initial conditions (starting point for forecasts)

2) Model Predictions

Weather models on the world's fastest super computers predict the future state of the weather based on current information and approximate equations

$$u \frac{\partial u}{r \partial \theta} + v \left(\frac{\partial u}{\partial r} + \frac{u}{r} + f \right) + \omega \frac{\partial u}{\partial p}$$
$$- \frac{\partial}{\partial r} \left[v \left(\frac{\partial u}{\partial r} + \frac{u}{r} \right) \right] + \frac{\partial}{r \partial \theta} \left[v \left(\frac{\partial u}{r \partial \theta} \right) \right]$$
$$+ \frac{\partial}{\partial p} \left[\kappa \left(\frac{\partial u}{\partial p} \right) \right],$$

$$u \frac{\partial v}{r \partial \theta} + v \frac{\partial v}{\partial r} - u \left(\frac{u}{r} + f \right) + \omega \frac{\partial v}{\partial p}$$
$$- -g \frac{\partial z}{\partial r} + \frac{\partial}{\partial r} \left[v \left(\frac{\partial v}{\partial r} + \frac{v}{r} \right) \right] + \frac{\partial}{r \partial \theta} \left[v \left(\frac{\partial v}{r \partial \theta} \right) \right]$$
$$+ \frac{\partial}{\partial p} \left[\kappa \left(\frac{\partial v}{\partial p} \right) \right] - \frac{2}{r^2} \frac{\partial (uv)}{\partial \theta},$$

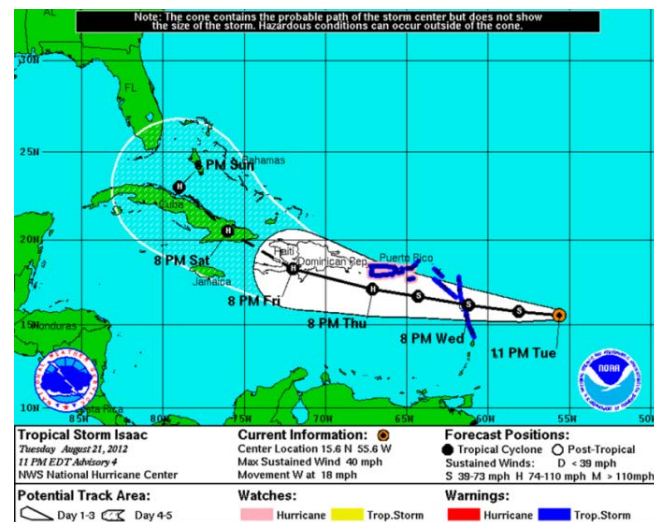

3) "Ensemble" of Forecasts

Different equations, initial conditions, and modelling techniques lead to a variety of predictions

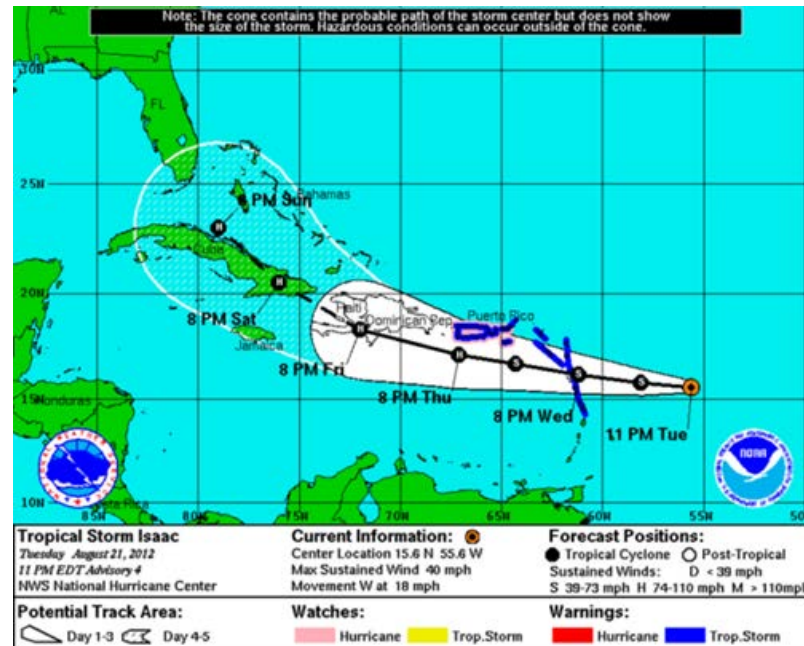

4) The Official Forecast

Forecasters at the National Hurricane Center examine computer model forecasts and issue the official forecast based on what they deem as the most likely scenario

What is the Cone?

- The “forecast cone” or “cone of uncertainty” predicts the path of the storm center (track forecast).
- It is not an impacts cone!

Making the Cone

- For 2 out of 3 forecasts:
 - The 24-hour true storm location will differ from its predicted track by less than 70 miles
 - At 48 hours ... by less than 95 miles
- Draw a circle for the possible location of the center of the hurricane at each forecast hour
- Outline the circles to complete the cone

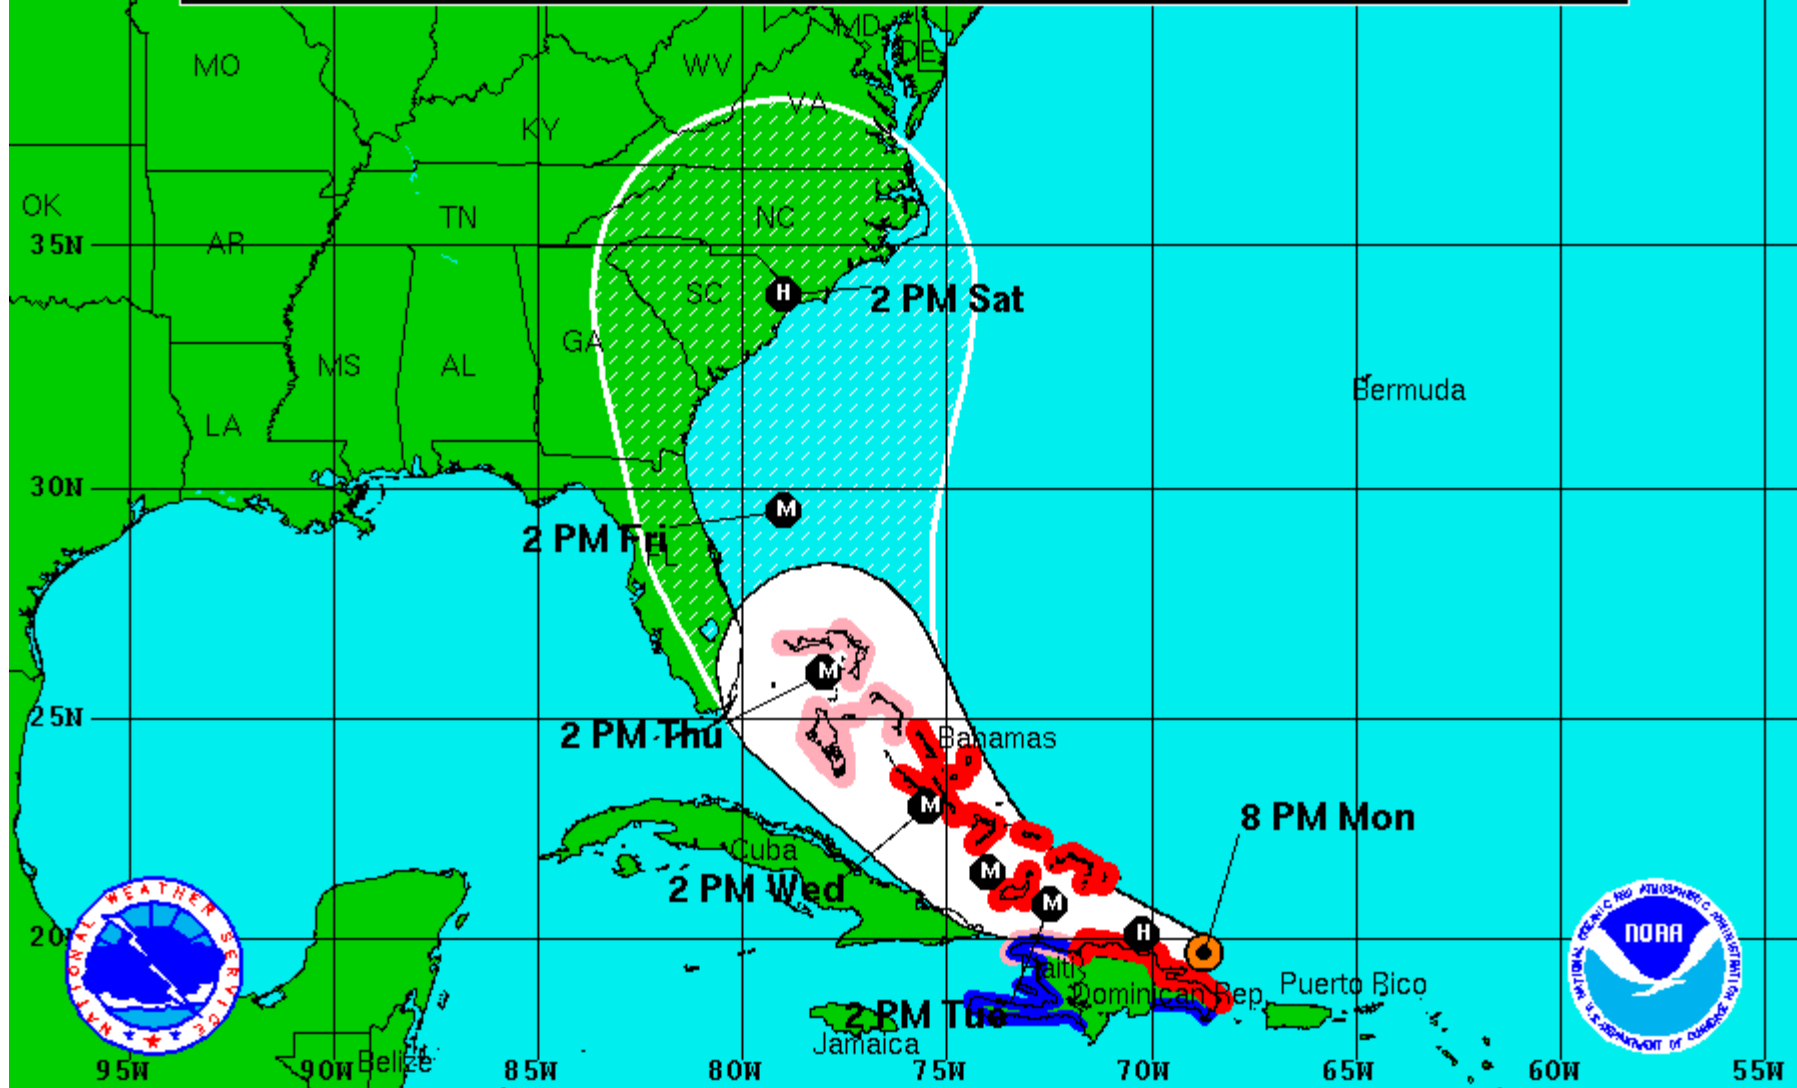

Smaller Errors = Smaller Cone

Do You Understand The Cone?

- Forecasts further out in time have more uncertainty.
- As track forecasts improve, the size of the cone decreases.
- Storms should leave the cone 1/3 of the time.
- The forecast cone is not an impacts cone!

Note: The cone of the probable path of the storm center but does not show the size of the storm. Hazardous conditions can occur outside of the cone.

Hurricane Irene
 Monday August 22, 2011
 830 PM EDT Advisory 10
 NWS National Hurricane Center

Current Information: 
 Center Location 19.7 N 68.7 W
 Max Sustained Wind 100 mph
 Movement WNW at 10 mph

Forecast Positions:
 Tropical Cyclone  Post-Tropical
 Sustained Winds: D < 39 mph
 S 39-73 mph H 74-110 mph M > 110mph

Potential Track Area:
 Day 1-3  Day 4-5

Watches:
 Hurricane  Trop.Storm

Warnings:
 Hurricane  Trop.Storm

What to Expect During a Hurricane Landfall

- Storm Surge
- Wind
- Rain
- Tornadoes
- Waves/Rip Currents

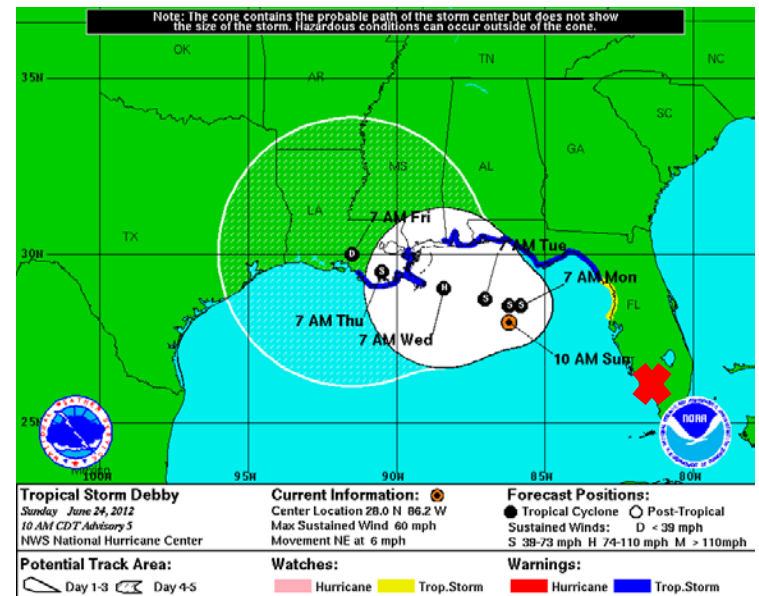

Wind, Rain, and Waves

Tornadoes

- Nearly 70% of landfalling hurricanes cause at least 1 tornado.
- These tornadoes most often occur in thunderstorms in rainbands away from the center of the hurricane.

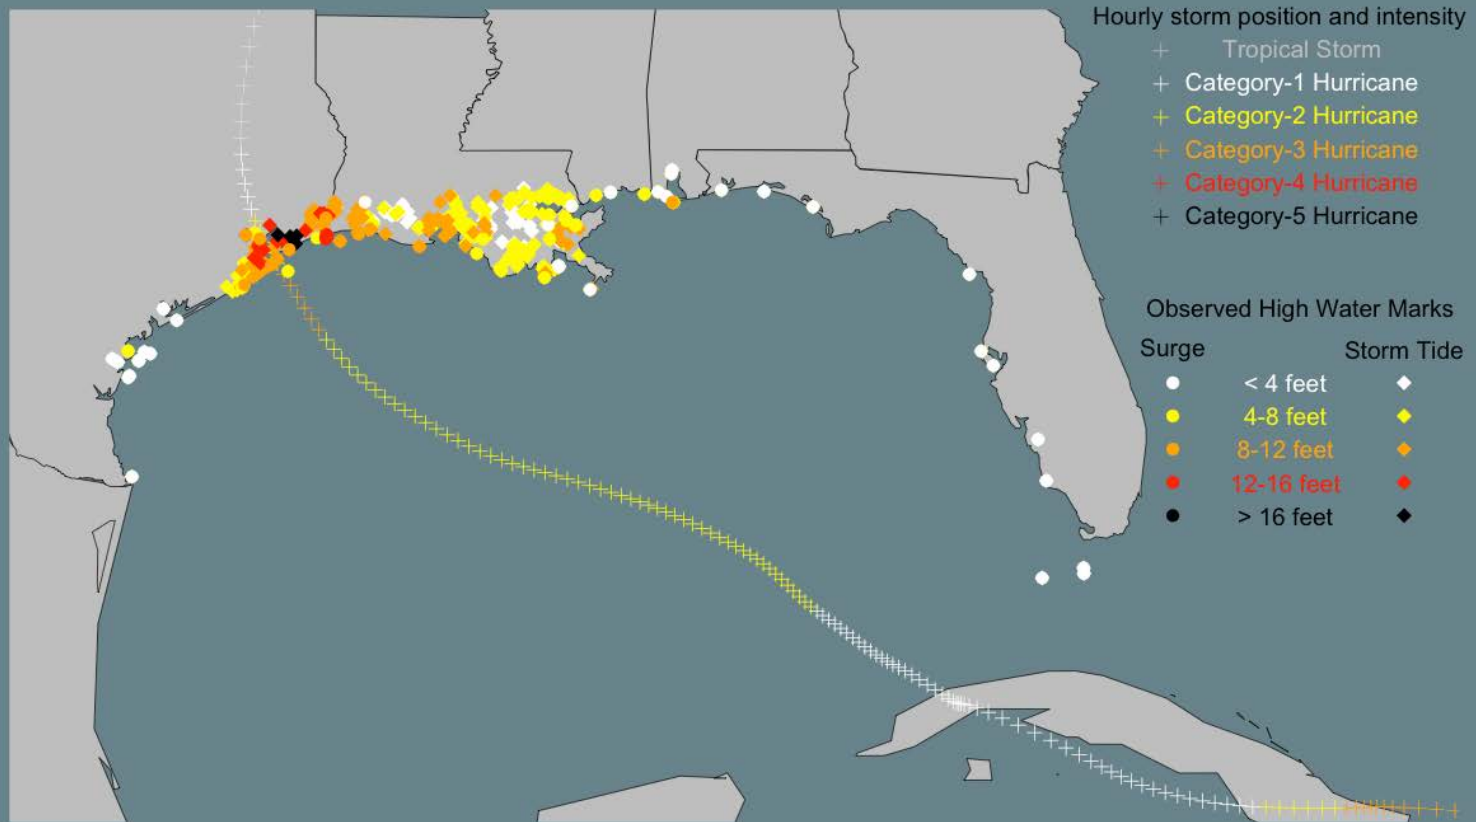

Storm Surge: Wind Pushing Water

- The #1 cause of deaths in hurricanes
- Storm surge is produced by water being pushed toward the shore by the storm winds

A Long-Distance Relationship

Hurricane Ike (2008) Wind, Position and Storm Surge/Storm Tide Data

Storm position and intensity data provided by Elsner and Jagger at Florida State Univ

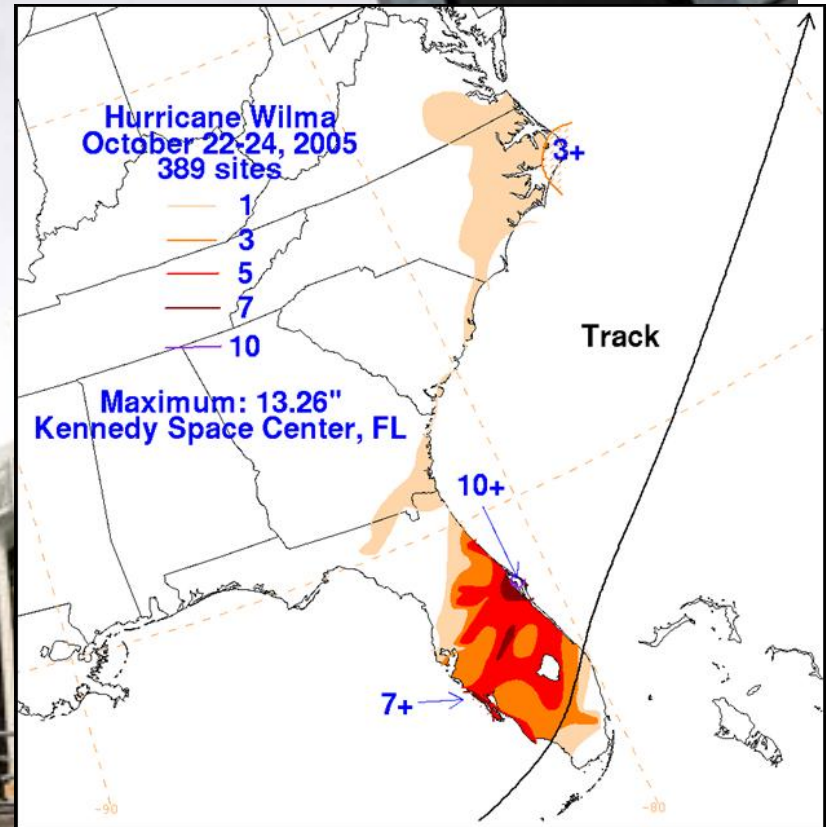

Storm surge data provided by SCIPP/SURGEDAT

Could we see this type of flooding in South Florida?

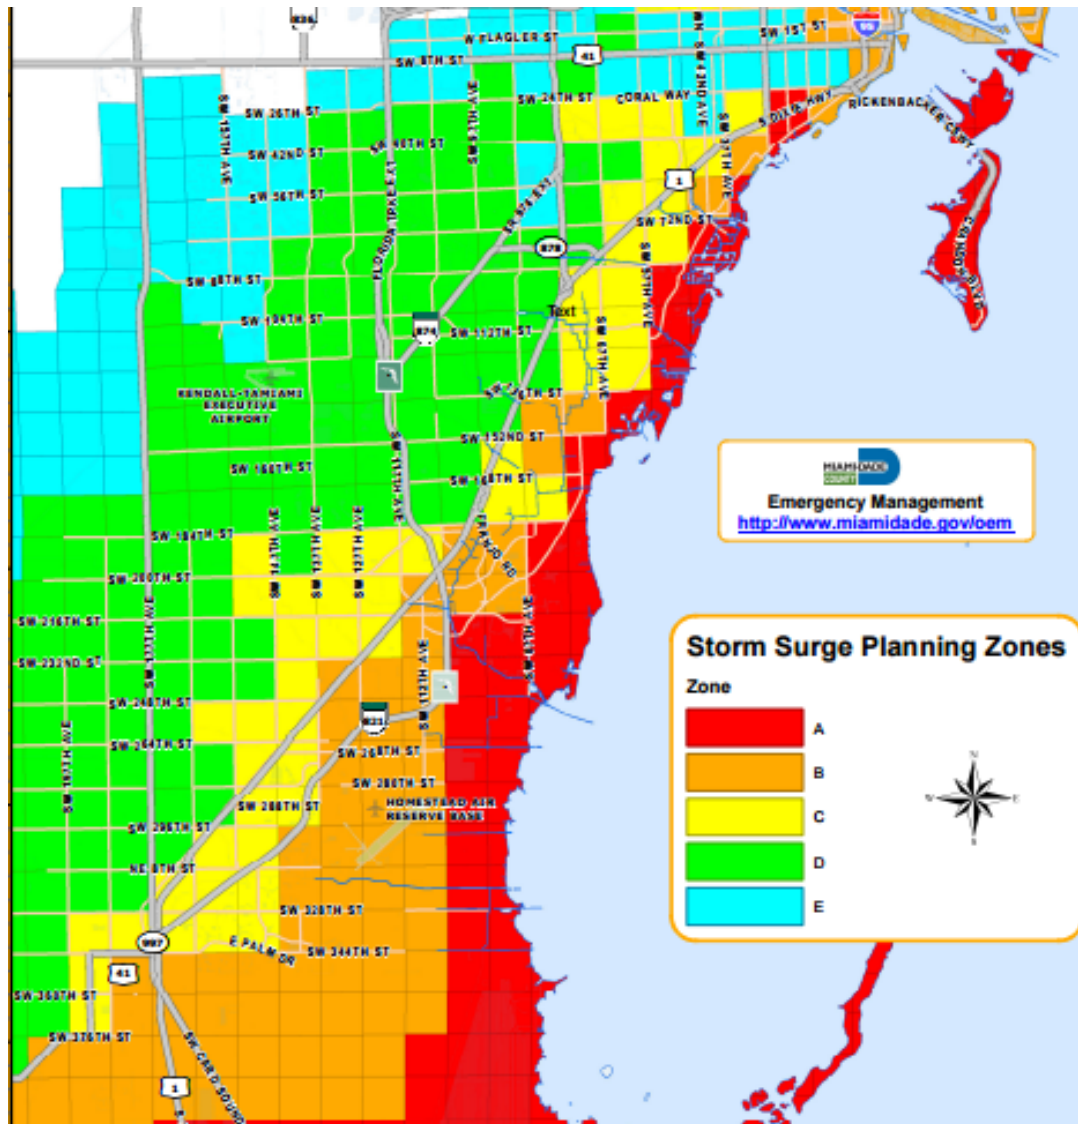

Hurricane Katrina (2005): New Orleans

Hurricane Wilma (2005): Miami

So... Know Your Zone

Lessons Learned

- Hurricanes and tropical storms (tropical cyclones) are named differently in different oceans and based on their wind speeds
- August through October is the peak of hurricane season for the U.S. but October is the busiest month for Florida
- The “cone of uncertainty” shows where the center of the storm will go 2/3 of time but the storm’s destruction can extend far beyond the cone (even if the track forecast is correct)
- Tropical cyclones have a variety of hazards but storm surge is responsible for the most damage and deaths
